Anton Gorodnichiy

Python Developer — Backend & Automation
anton.goro17@gmail.com

PROFILE

Python developer focused on backend logic, API integrations and internal tools. I define workflow requirements, direct AI-assisted development, and use manual testing and diagnosis to refine results. My portfolio includes controlled local demonstrations of selected private workflows.

SKILLS

Backend: Python, asyncio, FastAPI, HTTP APIs.
Data: SQLite, PostgreSQL, SQLAlchemy, Alembic.
Integrations: aiogram, Telethon, pyTelegramBotAPI, httpx.
Interfaces and checks: Jinja2, HTML/CSS/JavaScript, pytest, unittest.

SELECTED PROJECTS

Transactional Review Workflow — Defined review and reservation requirements; directed development and testing. Selected original logic now has synthetic concurrency, repeated-approval and restart checks.

Support Workflow Orchestrator — Defined incident and recovery rules; directed development and diagnosis. Selected original components have fake timeout and process-restart evidence.

Web Operations & Support Platform — Defined the support workflow and directed frontend/backend development. A separate narrow demo verifies request intake, operator reply and visitor isolation.

Local Operations Dashboard / Signed License Service — Implemented process-management and licensing components within the same larger project. These are two scoped case studies, not two unrelated products.

WORKING APPROACH

Clarify the task and acceptance checks, implement a focused change, investigate failure paths, and prepare handover notes. Portfolio: project index.

Communication: portfolio materials are available in English and Ukrainian.

Evidence status: local demonstrations and selected core checks are verified within their stated scope; full production applications and external integrations are not. Source code remains private.
