# Anton Gorodnichiy

**Python Developer — Backend & Automation**
anton.goro17@gmail.com

## PROFILE

Python developer focused on backend logic, API integrations and internal tools. I design and implement workflows, connect components, and diagnose state and integration problems. My portfolio presents selected private implementations with clear technical scope and limitations.

## SKILLS

**Backend:** Python, asyncio, FastAPI, HTTP APIs.
**Data:** SQLite, PostgreSQL, SQLAlchemy, Alembic.
**Integrations:** aiogram, Telethon, pyTelegramBotAPI, httpx.
**Interfaces and checks:** Jinja2, HTML/CSS/JavaScript, pytest, unittest.

## SELECTED PROJECTS

**Transactional Review Workflow** — Designed and implemented role-based review and reservation logic, SQL state transitions and guards against repeated processing.

**Support Workflow Orchestrator** — Implemented support-event processing, persistent action state and handling for uncertain integration outcomes.

**Web Operations & Support Platform** — Developed the browser support interface, Telegram administrator tools and request assignment. The portfolio presents these selected neutral capabilities.

**Local Operations Dashboard / Signed License Service** — Implemented process-management and licensing components within the same larger project. These are two scoped case studies, not two unrelated products.

## WORKING APPROACH

Clarify the task and acceptance checks, implement a focused change, investigate failure paths, and prepare handover notes. Portfolio: project index.

**Communication:** portfolio materials are available in English and Ukrainian.

**Evidence status:** project-based portfolio; implementation features reviewed in source; execution not verified during this review. Source code remains private.
